Notation

Recall: a point λ_0 is called a regular eigenvalue of A if it is an isolated point of the spectrum of A and the corresponding spectral projection has a finite dimensional range.

Define

$$\nu(A) = \sum_{\lambda_0 \in \sigma(A) \cap \mathbb{C}_-} \dim \operatorname{Im} P_{\{\lambda_0\}}(A)$$

if the intersection $\sigma(A) \cap \mathbb{C}_-$ consists only of a finite number of regular eigenvalues of A .

Otherwise, put $\nu(A) = \infty$.

Similarly for $\pi(A)$.

H-dissipative operators

Now recall the main result on H -dissipative operators. It is important in the proof of the main theorems.

Theorem *Let A be a bounded, dissipative operator on the Pontryagin space Π_κ .*

Assume that $\sigma(A) \cap \mathbb{R}$ consists entirely of points λ_0 for which $\dim \ker(A - \lambda_0 I) = 0$.

Then there is a κ -dimensional A -invariant subspace M which is maximal nonpositive, and is such that $\sigma(A|_M)$ is in the open lower half plane.

Sketch of proof I

$H = H^*$ invertible and $\kappa = \nu(H) < \infty$ implies that $[x, y] = \langle Hx, y \rangle$ induces on \mathcal{H} an indefinite inner product and makes it into a Π_κ space.

$$A^*H + HA \geq 0$$

implies that $B = iA$ is H -dissipative. Note that B does not have eigenvalues on the real line.

We conclude that there exists a κ -dimensional, A -invariant, maximal H -non-positive subspace M , such that $\sigma(A|_M)$ is entirely in \mathbb{C}^- . On the other hand, since $\sigma = \sigma(A) \cap \mathbb{C}^-$ is a spectral set, $\text{Im } P_\sigma(A)$ is a non-positive A -invariant subspace. From the maximality of M , it follows that $\dim \text{Im } P_\sigma(A) = \kappa$.

$\sigma(A) \cap \mathbb{C}^-$ is a bounded spectral set so $\sigma(A^{-1}) \cap \mathbb{C}^-$ is a spectral set.

$0 \neq \lambda \in \sigma_p(A)$ if and only if $\frac{1}{\lambda} \in \sigma_p(A^{-1})$

A boundedly invertible gives $0 \notin \sigma_p(A) \cup \sigma_p(A^{-1})$.

So A^{-1} does not have eigenvalues on imaginary axis.

So, applying the first theorem to the operator A^{-1} , we conclude that

$$\nu(H) = \nu(A^{-1})$$

But $\nu(A^{-1}) = \nu(A)$, and the theorem follows.
