- Strategies

Strategies

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

- \mathcal{S} is **deterministic** if $|\mathcal{S}(t)| = 1$ for every reducible term t

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

- \mathcal{S} is **deterministic** if $|\mathcal{S}(t)| = 1$ for every reducible term t
- \mathcal{S} **normalizes** term t if there are no infinite \mathcal{S} rewrite sequences starting from t

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

- \mathcal{S} is **deterministic** if $|\mathcal{S}(t)| = 1$ for every reducible term t
- \mathcal{S} **normalizes** term t if there are no infinite \mathcal{S} rewrite sequences starting from t
- \mathcal{S} is **normalizing** if it normalizes every term that has a normal form

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

- \mathcal{S} is **deterministic** if $|\mathcal{S}(t)| = 1$ for every reducible term t
- \mathcal{S} **normalizes** term t if there are no infinite \mathcal{S} rewrite sequences starting from t
- \mathcal{S} is **normalizing** if it normalizes every term that has a normal form
- \mathcal{S} is **perpetual** if every maximal \mathcal{S} rewrite sequence starting from any non-terminating term is infinite

Definition

A rewrite sequence is **maximal** if it is infinite, or it ends in a normal form.

Definition

A **rewrite strategy** \mathcal{S} is mapping that assigns to every reducible term t a nonempty set of finite nonempty rewrite sequences starting from t .

- \mathcal{S} is **deterministic** if $|\mathcal{S}(t)| = 1$ for every reducible term t
- \mathcal{S} **normalizes** term t if there are no infinite \mathcal{S} rewrite sequences starting from t
- \mathcal{S} is **normalizing** if it normalizes every term that has a normal form
- \mathcal{S} is **perpetual** if every maximal \mathcal{S} rewrite sequence starting from any non-terminating term is infinite

Definition

A rewrite sequence is **maximal** if it is infinite, or it ends in a normal form.

Lemma

For terminating TRSs every strategy is **normalizing** and **perpetual**.

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

- Consider a redex occurrence s in some term t_n of ρ .

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

- Consider a redex occurrence s in some term t_n of ρ .

Then s is **secured** if eventually there are no residuals of s left.

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

- Consider a redex occurrence s in some term t_n of ρ .

Then s is **secured** if eventually there are no residuals of s left.

That is, there exists $m > n$ such that t_m contains no residuals of s .

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

- Consider a redex occurrence s in some term t_n of ρ .

Then s is **secured** if eventually there are no residuals of s left.

That is, there exists $m > n$ such that t_m contains no residuals of s .

- The reduction ρ is **fair** if every redex occurring in ρ is secured.

Definition

Let $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ be a finite or infinite rewrite sequence.

- Consider a redex occurrence s in some term t_n of ρ .

Then s is **secured** if eventually there are no residuals of s left.

That is, there exists $m > n$ such that t_m contains no residuals of s .

- The reduction ρ is **fair** if every redex occurring in ρ is secured.

Definition

A strategy \mathcal{S} is **fair** if every every maximal \mathcal{S} rewrite sequence is fair.

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

For the term:

$$t = I(I(x))$$

there are only 3 possible mappings:

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

For the term:

$$t = I(I(x))$$

there are only 3 possible mappings:

- $\mathcal{S}(t) = \{I(I(x)) \rightarrow_{\varepsilon} I(I(x))\}$,

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

For the term:

$$t = I(I(x))$$

there are only 3 possible mappings:

- $S(t) = \{I(I(x)) \rightarrow_\epsilon I(I(x))\}$,
- $S(t) = \{I(I(x)) \rightarrow_1 I(I(x))\}$, or

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

For the term:

$$t = I(I(x))$$

there are only 3 possible mappings:

- $\mathcal{S}(t) = \{I(I(x)) \rightarrow_{\varepsilon} I(I(x))\}$,
- $\mathcal{S}(t) = \{I(I(x)) \rightarrow_1 I(I(x))\}$, or
- $\mathcal{S}(t) = \{I(I(x)) \rightarrow_{\varepsilon} I(I(x)), I(I(x)) \rightarrow_1 I(I(x))\}$.

Definition

A **one-step** strategy maps every reducible term to a set of one-step reductions.

Example

There exists no fair one-step strategy for $\mathcal{R} = \{I(x) \rightarrow I(x)\}$.

For the term:

$$t = I(I(x))$$

there are only 3 possible mappings:

- $S(t) = \{I(I(x)) \rightarrow_\varepsilon I(I(x))\}$,
- $S(t) = \{I(I(x)) \rightarrow_1 I(I(x))\}$, or
- $S(t) = \{I(I(x)) \rightarrow_\varepsilon I(I(x)), I(I(x)) \rightarrow_1 I(I(x))\}$.

None of these is fair as we can always continue to reduce the same occurrence of I .

Example

- rewrite rules

$$\begin{array}{llll}
 0 + 0 \rightarrow 0 & 1 + 0 \rightarrow 1 & \dots & 9 + 0 \rightarrow 9 \\
 0 + 1 \rightarrow 1 & 1 + 1 \rightarrow 2 & \dots & 9 + 1 \rightarrow 1 : 0 \\
 0 + 2 \rightarrow 2 & 1 + 2 \rightarrow 3 & \dots & 9 + 2 \rightarrow 1 : 1 \\
 0 + 3 \rightarrow 3 & 1 + 3 \rightarrow 4 & \dots & 9 + 3 \rightarrow 1 : 2 \\
 0 + 4 \rightarrow 4 & 1 + 4 \rightarrow 5 & \dots & 9 + 4 \rightarrow 1 : 3 \\
 0 + 5 \rightarrow 5 & 1 + 5 \rightarrow 6 & \dots & 9 + 5 \rightarrow 1 : 4 \\
 0 + 6 \rightarrow 6 & 1 + 6 \rightarrow 7 & \dots & 9 + 6 \rightarrow 1 : 5 \\
 0 + 7 \rightarrow 7 & 1 + 7 \rightarrow 8 & \dots & 9 + 7 \rightarrow 1 : 6 \\
 0 + 8 \rightarrow 8 & 1 + 8 \rightarrow 9 & \dots & 9 + 8 \rightarrow 1 : 7 \\
 0 + 9 \rightarrow 9 & 1 + 9 \rightarrow 1 : 0 & \dots & 9 + 9 \rightarrow 1 : 8 \\
 x + (y : z) \rightarrow y : (x + z) & & & 0 : x \rightarrow x \\
 (x : y) + z \rightarrow x : (y + z) & & & x : (y : z) \rightarrow (x + y) : z
 \end{array}$$

- term

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6)$$

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

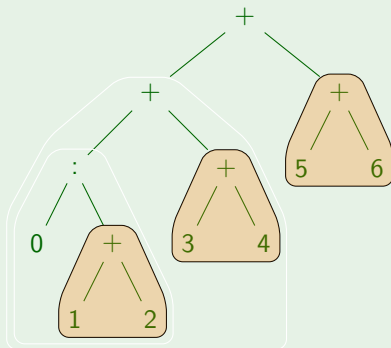

outermost redexes

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

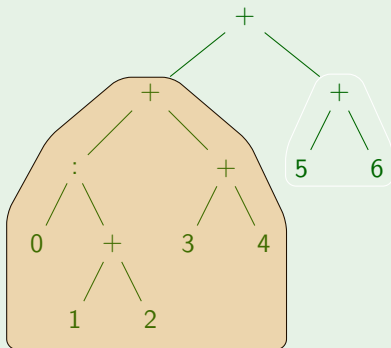

innermost redexes

Example (cont'd)

term

$$0 : \boxed{1 + 2} + \boxed{3 + 4} + \boxed{5 + 6}$$

tree representation

leftmost outermost strategy

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

leftmost innermost strategy

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

parallel outermost strategy

Example (cont'd)

term

$$0 : 1 + 2 + 3 + 4 + 5 + 6$$

tree representation

parallel innermost strategy

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6)$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6) \rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6)$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned} ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\ &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\ &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\ &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6)\end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + (3 + 4)) + (5 + 6)
 \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + 7) + (5 + 6)
 \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + 7) + (5 + 6) \\
 &\rightarrow (1 : 0) + (5 + 6)
 \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + 7) + (5 + 6) \\
 &\rightarrow (1 : 0) + (5 + 6) \\
 &\rightarrow 1 : (0 + (5 + 6))
 \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + (3 + 4)) + (5 + 6) \\
 &\rightarrow (3 + 7) + (5 + 6) \\
 &\rightarrow (1 : 0) + (5 + 6) \\
 &\rightarrow 1 : (0 + (5 + 6)) \\
 &\rightarrow 1 : (0 + (1 : 1))
 \end{aligned}$$

Definition

Leftmost outermost strategy always reduces the leftmost or the outermost redexes.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\rightarrow (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\

 &\rightarrow 1 : (1 : 1) \\
 &\rightarrow (1 + 1) : 1 \\
 &\rightarrow 2 : 1
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6)$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6) \Downarrow (0 : ((1 + 2) + (3 + 4))) + (1 : 1)$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1))
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (1 : 1)
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (1 : 1) \\
 &\rightarrow 1 : (((1 + 2) + (3 + 4)) + 1)
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (1 : 1) \\
 &\rightarrow 1 : (((1 + 2) + (3 + 4)) + 1) \\
 &\multimap 1 : ((3 + 7) + 1)
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\
 &\rightarrow ((1 + 2) + (3 + 4)) + (1 : 1) \\
 &\rightarrow 1 : (((1 + 2) + (3 + 4)) + 1) \\
 &\multimap 1 : ((3 + 7) + 1) \\
 &\rightarrow 1 : ((1 : 0) + 1)
 \end{aligned}$$

Definition

Parallel outermost strategy always reduces all outermost redexes in parallel.

Example (cont'd)

$$\begin{aligned}
 ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) &\multimap (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\
 &\rightarrow 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\

 &\rightarrow 2 : 1
 \end{aligned}$$

Definition

A **development** of set of redex positions Q in term t is rewrite sequence starting from t in which all contracted redex positions descend from position in Q .

Example

- rewrite rules

$$\begin{array}{ll} 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\ s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y \end{array}$$

- rewrite sequences

$$\underline{s(0) \times (0 \times 0)} \rightarrow (0 \times \underline{(0 \times 0)}) + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😊}$$

Definition

A development of set of redex positions Q in term t is rewrite sequence starting from t in which all contracted redex positions descend from position in Q .

Example

- rewrite rules

$$\begin{array}{ll}
 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\
 s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y
 \end{array}$$

- rewrite sequences

$$\underline{s(0) \times (0 \times 0)} \rightarrow (0 \times \underline{(0 \times 0)}) + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😊}$$

$$\underline{s(0) \times (0 \times 0)} \rightarrow \underline{(0 \times (0 \times 0))} + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😞}$$

Definition

A development of set of redex positions Q in term t is rewrite sequence starting from t in which all contracted redex positions descend from position in Q .

Example

- rewrite rules

$$\begin{array}{ll} 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\ s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y \end{array}$$

$$\underline{s(0) \times (0 \times 0)} \rightarrow (0 \times \underline{(0 \times 0)}) + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😊}$$

$$\underline{s(0) \times (0 \times 0)} \rightarrow \underline{(0 \times (0 \times 0))} + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😞}$$

$$s(0) \times \underline{(0 \times 0)} \rightarrow \underline{s(0) \times 0} \rightarrow (0 \times 0) + 0 \quad \text{😊}$$

Definition (Overlining)

For a TRS $\mathcal{R} = \langle \Sigma, R \rangle$ we define the **overlined** TRS $\overline{\mathcal{R}} = \langle \overline{\Sigma}, \overline{R} \rangle$:

- $\overline{\Sigma} = \Sigma \cup \{\overline{f} \mid f \in \Sigma\}$,
- $\overline{R} = \{\overline{\rho} \mid \rho \in R\}$

where $\overline{\rho}$ is obtained from ρ by overlining the head symbol of the left-hand side.

$$\rho : f(s_1, \dots, s_n) \rightarrow r \quad \text{yields} \quad \overline{\rho} : \overline{f}(s_1, \dots, s_n) \rightarrow r$$

Definition (Overlining)

For a TRS $\mathcal{R} = \langle \Sigma, R \rangle$ we define the **overlined** TRS $\overline{\mathcal{R}} = \langle \overline{\Sigma}, \overline{R} \rangle$:

- $\overline{\Sigma} = \Sigma \cup \{\overline{f} \mid f \in \Sigma\}$,
- $\overline{R} = \{\overline{\rho} \mid \rho \in R\}$

where $\overline{\rho}$ is obtained from ρ by overlining the head symbol of the left-hand side.

$$\rho : f(s_1, \dots, s_n) \rightarrow r \quad \text{yields} \quad \overline{\rho} : \overline{f}(s_1, \dots, s_n) \rightarrow r$$

Example

The overlined version of Combinatory Logic:

$$\begin{array}{lcl} \overline{Ap}(Ap(Ap(S, x), y), z) & \rightarrow & Ap(Ap(x, z), Ap(y, z)) \\ \overline{Ap}(Ap(K, x), y) & \rightarrow & x \\ \overline{Ap}(I, x) & \rightarrow & x \end{array}$$

We write $t \geq s$ if t can be obtained from s by overlining some redex positions.

Definition (Lifting)

A \mathcal{R} rewrite sequence $A : s_1 \rightarrow s_2 \rightarrow \dots \rightarrow s_n$ can be **lifted** if:

$$\begin{array}{ccccccc}
 t_1 & \xrightarrow{\langle \bar{\rho}_1, \rho_1 \rangle} & t_2 & \xrightarrow{\langle \bar{\rho}_2, \rho_2 \rangle} & \dots & \xrightarrow{\langle \bar{\rho}_{n-1}, \rho_{n-1} \rangle} & t_n \\
 \forall \downarrow & & \forall \downarrow & & & & \forall \downarrow \\
 s_1 & \xrightarrow{\langle \rho_1, \rho_1 \rangle} & s_2 & \xrightarrow{\langle \rho_2, \rho_2 \rangle} & \dots & \xrightarrow{\langle \rho_{n-1}, \rho_{n-1} \rangle} & s_n
 \end{array}$$

for some $\bar{\mathcal{R}}$ rewrite sequence $B : t_1 \rightarrow \dots \rightarrow t_n$.

We write $t \geq s$ if t can be obtained from s by overlining some redex positions.

Definition (Lifting)

A \mathcal{R} rewrite sequence $A : s_1 \rightarrow s_2 \rightarrow \dots \rightarrow s_n$ can be **lifted** if:

$$\begin{array}{ccccccc}
 t_1 & \xrightarrow{\langle \bar{\rho}_1, \rho_1 \rangle} & t_2 & \xrightarrow{\langle \bar{\rho}_2, \rho_2 \rangle} & \dots & \xrightarrow{\langle \bar{\rho}_{n-1}, \rho_{n-1} \rangle} & t_n \\
 \forall \downarrow & & \forall \downarrow & & & & \forall \downarrow \\
 s_1 & \xrightarrow{\langle \rho_1, \rho_1 \rangle} & s_2 & \xrightarrow{\langle \rho_2, \rho_2 \rangle} & \dots & \xrightarrow{\langle \rho_{n-1}, \rho_{n-1} \rangle} & s_n
 \end{array}$$

for some $\bar{\mathcal{R}}$ rewrite sequence $B : t_1 \rightarrow \dots \rightarrow t_n$.

Lemma

For orthogonal TRSs: a reduction is a development \iff it can be lifted.

Theorem

Properties of $\overline{\mathcal{R}}$ for orthogonal TRSs \mathcal{R} :

- $\overline{\mathcal{R}}$ is orthogonal.
- $\overline{\mathcal{R}}$ is SN.
- $\overline{\mathcal{R}}$ is CR.

For SN we show that $\overline{\mathcal{R}}$ is ILPO terminating where $\bar{f} > g$ for every $f, g \in \Sigma$.

Let $\ell = \bar{f}(\ell_1, \dots, \ell_n)$ and $r \in \mathcal{T}(\Sigma, \mathcal{X})$ with $\text{Var}(r) \subseteq \text{Var}\ell$.

Then $\ell^* \rightarrow_{ilpo}^* r$ by induction on r :

- If $r \in \text{Var}(\ell)$, then we use \rightarrow_{put} and \rightarrow_{select} .
- If $r = g(r_1, \dots, r_m)$, then we use $\ell^* \rightarrow_{copy} g(\ell^*, \dots, \ell^*)$.
Moreover by the induction hypothesis $\ell^* \rightarrow_{ilpo}^* r_i$ for every i .

Theorem

Properties of $\overline{\mathcal{R}}$ for orthogonal TRSs \mathcal{R} :

- $\overline{\mathcal{R}}$ is orthogonal.
- $\overline{\mathcal{R}}$ is SN.
- $\overline{\mathcal{R}}$ is CR.

Proof.

The orthogonality of $\overline{\mathcal{R}}$ is immediate. Hence $\overline{\mathcal{R}}$ is CR.

Definition

A reduction $\rho = t_0 \rightarrow t_1 \rightarrow \dots$ is **cofinal** if for every $t_0 \rightarrow^* s$ there exists t_n in ρ such that $s \rightarrow^* t_n$.

Let t_0 be a term that has a normal form u ($t_0 \rightarrow^* u$).

Consider a maximal \mathcal{S} rewrite sequence $\rho : t_0 \rightarrow t_1 \rightarrow \dots$ starting from t_0 .

By cofinality there must be t_n in ρ such that $u \rightarrow^* t_n$.

Hence $t_n = u$ since u is a normal form. ■

Theorem

For orthogonal TRSs, every fair strategy is cofinal.

Let $\tau : t_0 \rightarrow u_0$. We show that $u_0 \rightarrow^* t_n$ for some t_n in ρ .

$$\begin{array}{ccccccc}
 t_0 & \longrightarrow & t_1 & \longrightarrow & t_2 & \longrightarrow & \dots & \longrightarrow & t_n & \longrightarrow & \dots \\
 \downarrow \tau & & \downarrow \tau/\rho_1 & & \downarrow \tau/\rho_2 & & & & & & \downarrow \emptyset \\
 u_0 & \longrightarrow & u_1 & \longrightarrow & u_2 & \longrightarrow & \dots & \longrightarrow & u_n & &
 \end{array}$$

Here ρ_i consists of the first i steps of ρ .

By fairness of ρ there exists n such that $\tau/\rho_n = \emptyset$. Hence $u_n = t_n$ and $u_0 \rightarrow^* t_n$.

The reduction $u_0 \rightarrow u_1 \rightarrow \dots \rightarrow u_n \rightarrow t_{n+1} \rightarrow t_{n+2}$ is fair again.
(every redex occurrence in t_n is eventually secured)

By induction over the length of $t_0 \rightarrow^* u_0$ we get $u_0 \rightarrow^* t_n$ for some t_n in ρ . ■

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$ ☹️

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$ ☹️
- $f(g(x, y), z) \rightarrow g(x, g(y, z))$

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$ ☹️
- $f(g(x, y), z) \rightarrow g(x, g(y, z))$ 😊

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$ ☹️
- $f(g(x, y), z) \rightarrow g(x, g(y, z))$ 😊

Theorem

Leftmost outermost strategy is normalizing for orthogonal left-normal TRSs.

Definition

A TRS is **left-normal** if variables do not precede function symbols in left-hand sides (where the left-hand sides are written in prefix notation).

Example

- $f(x, g(y, z)) \rightarrow g(y, f(x, z))$ ☹️
- $f(g(x, y), z) \rightarrow g(x, g(y, z))$ 😊

Theorem

Leftmost outermost strategy is normalizing for orthogonal left-normal TRSs.

Remark

Combinatory Logic is left-normal

$$I x \rightarrow x$$

$$K x y \rightarrow x$$

$$S x y z \rightarrow x z (y z)$$
